

How it works

Every seed is unique and demands its own specific adjustment on the machine with the aid of the seed chart.

The seed is conveyed from the hopper to the cam wheel. This is continuously driven, so the seed is transported over the bottom flap towards a V-shaped edge, which spreads the seed evenly into the seed tubes.

The contour following elements are regulated by a progressive spring load.

The scraping block scrapes clean the inside of the discs.

Sharp self-maintaining discs are manufactured from very durable material.

The independently hung elements, with a single pivot point, follow the contours of the ground perfectly.

The turf guard ensures that:

1. You obtain a sharp edged clean slot.
2. The discs stay clean.
3. The adjustable sowing depth is optimal.

The sealed bearings are maintenance free.

The combination of the double discs, pressurized spring, and the turf guard, makes sure that the seed is being deposited at the correct depth for the most efficient use of expensive grass seed.
